

## THE COLLECTION OF LEPIDOPTERA PRESERVED AT THE "LUCIAN BLAGA" UNIVERSITY- SIBIU (NOTE 2)

STANCĂ-MOISE Cristina

**Abstract.** The present paper is a continuation of the systematic list of Lepidoptera species preserved in the Collection of "Lucian Blaga" University of Sibiu. In the year 2000, it was published the Catalogue of this collection but only with partial data. After a new acquisition, the value of the collection increased. The present paper presents the updated systematic list of Suprafamily Noctuoidea - with Subfamily Pygaerinae (36 species), Herminiinae (11 species), Acontiinae (10 species), Psaphidininae (5 species), Stiriinae (44 species), Hadeninae (58 species), Noctuinae (37 species), and Family Lymantriidae (9 species). The total number of 211 species and 471 samples are presented with the data and place of collection, the number of samples and their sex. Their name was updated and the endangered degree is mentioned at all species according to "Verzeichnis der Schmetterlinge Romäniens" (RÁKOSY et al., 2003).

**Keywords:** Lepidoptera, collection, species.

**Rezumat. Lepidoptere din colecția Universității „Lucian Blaga” din Sibiu (nota 2).** Prezenta lucrare este o continuare a listei sistematice a speciilor de lepidoptere existente în colecția Universității „Lucian Blaga” din Sibiu. În anul 2000, a fost publicat catalogul acestei colecții, cu date parțiale. După achiziția ulterioară a altor specii și introducerea lor în colecție a crescut valoarea prin completarea sa. Lucrarea de față prezintă lista sistematică actualizată a Suprafam. Noctuoidea (cu Subfam. Pygaerinae (36 de specii), Herminiinae (11 specii), Acontiinae (10 specii), Psaphidininae (5 specii), Stiriinae (44 de specii), Hadeninae (58 de specii), Noctuinae (37 de specii), și Fam. Lymantriidae (9 specii) reprezentând în total un număr de 211 specii și 471 exemplare. Pe lângă datele și locul de colectare, sunt menționate numărul de indivizi și sexul acestora, cu actualizarea denumirilor, indicarea zonelor unde au fost semnalate în România și a gradului de periclitate conform *Catalogului lepidopterelelor României* (RÁKOSY et al., 2003).

**Cuvinte cheie:** lepidoptere, colecție, specii.

### INTRODUCTION

Following the International Convention held in Rio de Janeiro, Brazil in 1992, where Romania joined, biodiversity conservation, plant and animal species, became a priority. Since 1999, the research has covered fauna inventory of Romania, subject to aggression or other anthropogenic factors, and the measures that must be taken to preserve them (DAVIDESCU, 2002).

Lepidoptera collection of "Lucian Blaga" University has a special documentary and scientific value. Publishing papers offer a data base for specialists for further research. The species available in the collection come mostly from Romania being collected from lower altitudes of 6 m in Dobrogea (Canaraua Fetii) (RÁKOSY & SZEKELY, 1996), the Danube Delta (Periprava, Maliuc) up to 2100 m in the mountains (Vrancea Mountains, Retezat Mountains, Bucegi and Fagaras Mountains). The collection was gathered between 1979 and 2000. This is important as a starting point for further study of the previous situation and evolution in time of Lepidoptera fauna. There is one exception, a species collected from another country, Germany, Daining: 1♀ *Papestra biren* Goeze, 1781, July 17, 1981.

### MATERIALS AND METHOD

The material that is the subject of this study was collected by lepidopterologist Levente Szekely between 1972-2000 from Romania (SZÉKELY, 1994, 1995, 1996, 1999a, b, 2003a, b, 2006, 2007, 2008, 2010, 2011).

In this paper, the oldest data of collection is 1979 1♀ de *Cerapteryx graminis* Linnaeus, 1758, a specimen collected from Roșu Lake (August 2, 1979), 1300 m alt.

The material was collected by means of entomological net for diurnal species and with a light source Noctuidae. On the labels, there are noted (day-month-year-sex-of the collected specimens, the geographical zone and altitude). The material was arranged in entomological boxes in systematic order in the Lepidoptera Collection of "Lucian Blaga" University of Sibiu.

In the present study, there are enumerated 211 species from the total 572 species of the collection and the other part of 146 species will presented in a future paper.

### RESULTS AND DISCUSSIONS

In the present paper, there were inventoried 211 species of the Lepidoptera Collection of "Lucian Blaga" University of Sibiu. From Noctuidae Superfamily (with Subfamily Pygaerinae (36 species), Herminiinae (11 species), Acontiinae (10 species), Psaphidininae (5 species), Stiriinae (44 species), Hadeninae (58 species), Noctuinae (37 species)), there are listed in total 202, while 9 species belong to the Family Lymantriidae.

In terms of the degree of endangerment, of the 211 species presented in the paper, 59 species fall into different categories: 44 species NT (Near threatened), 10 species VU (Vulnerable), 3 species EN (Endangered) and 2 species DD (Data Deficient) and the difference of 152 species are not in danger.

The following abbreviations were used: **CR** - Critically endangered, it is estimated that the survival of these species in the next 10-20 years is unlikely if the factors that have caused this situation are not eliminated; after the analysis of the quantitative cost it was determined a decay rate of the population with at least 50% in the last 10 years. **EN** - Endangered, endangered taxa when there is a critical stage of threat, but shows high risk or the extinction threat is critical in the immediate future; it is estimated a probability of about 20% extinction in the next 20 years, **VU**-Vulnerable, a taxon is vulnerable when it is not in the critical threat or endangered, but have a high risk of extinction or critical threat in the near future, **NT**- Near threatened, includes taxa not included in CR, EN or VU, **DD** - Data deficient, but in case the degree of threat increases, it may be included in one or other of the three categories. This category largely replaces RL variant category IUCN 2000, (RÁKOSY, 2002, 2003, 2005).

## CONCLUSIONS

This paper contributes to the study of Lepidoptera fauna of Romania. The material was collected during 1979-2000 and could be found in the Lepidoptera collection of "Lucian Blaga" University of Sibiu. From the 572 existing species in this collection, there are presented only 211 species and 471 samples belonging to the Suprafamily Noctuoidea with six Subfamilies - Pygaerinae (36 species), Herminiinae (11 species), Acontiinae (10 species), Psaphidiniinae (5 species), Stiriinae (44 species), Hadeninae (58 species), Noctuininae (37 species) and the Family Lymantriidae. The list of species is updated after *Verzeichnis der Schmetterlinge Romäniens* (RÁKOSY et al., 2003). There are presented the geographical areas where these species were collected from; the most important aspect is the IUCN classification of the degree of endangerment of each species. The documentary and scientific value of the Lepidoptera collection of "Lucian Blaga" University offers to those interested a valuable documentary material that can be used for systematic, faunistic and zoogeographical studies.

## AKNOWLEDGEMENTS

I thank to Mr. Levente Szekely from Brașov for this small part (572 species) of his own rich collection (40,000 samples, with 2,600 species) that he sold to our institution, "Lucian Blaga" University-Sibiu. I want to present homage to Prof. univ. dr. biol. Victor Ciochia who was the initiator of the acquisition of this collection and with whom I have worked to organised it.
